

Assignment -2

Python Programming

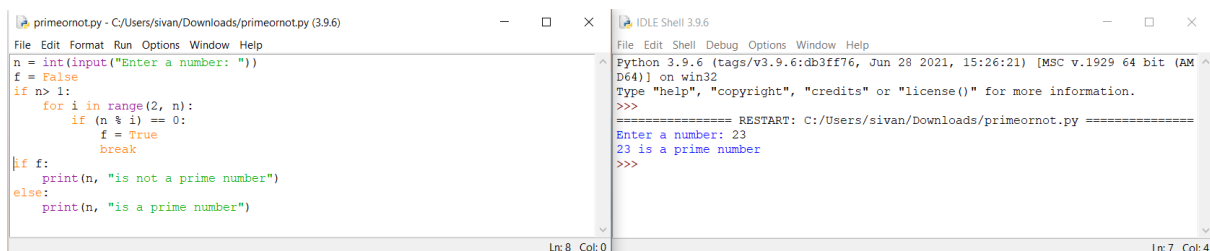

Assignment Date	19 September 2022
Student Name	Vijithra P
Student Roll Number	820419104084
Maximum Marks	2 Marks

Question-1:

Write a python program to test a given number is prime or not.

Solution :

```
n = int(input("Enter a
number: "))
f = False
if n > 1:
    for i in range(2, n):
        if (n % i) == 0:
            f = True
            break
if f:
    print(n, "is not a prime
number")
else:
    print(n, "is a prime
number")
```

The screenshot shows a Python IDE with two windows. The left window displays the source code for a program to check if a number is prime. The code uses a loop to test divisibility from 2 to n-1. If a divisor is found, it sets a flag 'f' to True and breaks the loop. If 'f' is True, it prints that the number is not prime; otherwise, it prints that the number is prime. The right window shows the execution of the program. It prompts the user to enter a number, and the user enters 23. The program outputs '23 is a prime number'.

```
primeornot.py - C:/Users/sivan/Downloads/primeornot.py (3.9.6)
File Edit Format Run Options Window Help
n = int(input("Enter a number: "))
f = False
if n > 1:
    for i in range(2, n):
        if (n % i) == 0:
            f = True
            break
if f:
    print(n, "is not a prime number")
else:
    print(n, "is a prime number")
Ln: 8 Col: 0

IDLE Shell 3.9.6
File Edit Shell Debug Options Window Help
Python 3.9.6 (tags/v3.9.6:db3ff76, Jun 28 2021, 15:26:21) [MSC v.1929 64 bit (AMD64)] on win32

>>>
===== RESTART: C:/Users/sivan/Downloads/primeornot.py =====
Enter a number: 23
23 is a prime number
>>>
```

Question-2:

Write a program to generate odd numbers from m to n using while loop

Solution :

```
min = int(input(" Enter any min value:"))
max = int(input(" Enter any max Value : "))
X=1;
if (min < max):
```

```

while X in range(min,max+ 1):
    if( X % 2 != 0):
        print("{0}".format(X))
        X=X+1;
else:
    print("min value you've entered is greater than max value")

```

The screenshot shows two windows. The left window is the Python script editor for 'odd.py', and the right window is the IDLE Shell. The shell shows the program's execution: it prompts for a min value (1) and a max value (5), then prints the odd numbers in that range: 1, 3, 5.

Question-3:

Write a Python program to display prime number series upto given number.

Solution :

```

l = 1
u = int(input("Enter the number : "))
print("Prime numbers between",1,"and",u,"are:")
for n in range(l,u + 1):
    if n > 1:
        for i in range(2, n):
            if (n%i) == 0:
                break
        else:
            print(n)

```

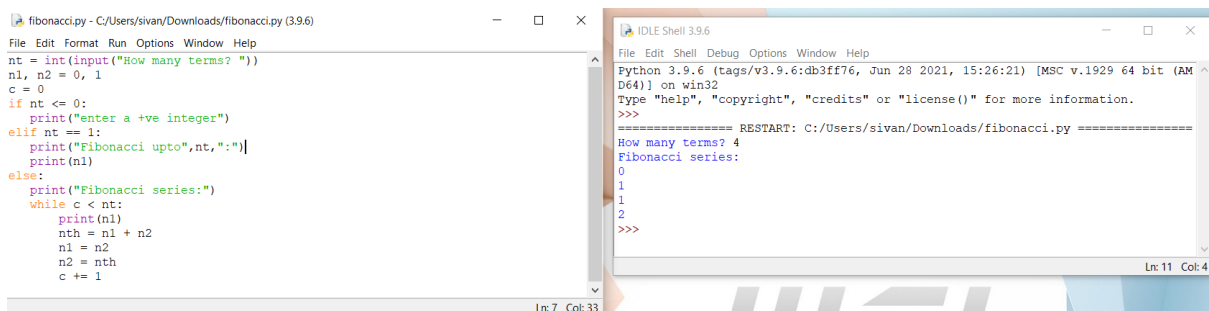

The screenshot shows two windows. The left window is the Python script editor for 'primenumberrange.py', and the right window is the IDLE Shell. The shell shows the program's execution: it prompts for a number (10) and prints the prime numbers between 1 and 10: 2, 3, 5, 7.

Question-4:

Write a Python program to generate Fibonacci series.

Solution :

```
nt = int(input("How many terms? "))
n1, n2 = 0, 1
c = 0
if nt <= 0:
    print("enter a +ve integer")
elif nt == 1:
    print("Fibonacci upto",nt,":")
    print(n1)
else:
    print("Fibonacci series:")
    while c < nt:
        print(n1)
        nth = n1 + n2
        n1 = n2
        n2 = nth
        c += 1
```

The screenshot displays a Python IDE with two windows. The left window, titled 'fibonacci.py - C:/Users/sivan/Downloads/fibonacci.py (3.9.6)', contains the source code for the Fibonacci series program. The right window, titled 'IDLE Shell 3.9.6', shows the program's execution. The user has entered '4' for the number of terms. The output shows the first four terms of the Fibonacci series: 0, 1, 1, 2. The status bar at the bottom of the IDE indicates 'Ln: 7 Col: 33' for the code editor and 'Ln: 11 Col: 4' for the shell.
